

Stored authenticated-reference sensitivity Reported paired IC50 ratios versus frozen Equal_mean

n=6 nonoverlap paired compounds: 3 point ratios, 1 strict bound(s), 2 without a finite ratio bound

Filled circles: point ratios of reported means. Open triangles/arrows: strict censoring-derived bounds, not CIs.
Crosses: both targets >50 μM; any positive R remains possible. Untested and overlapping rows remain in the complete table.

Source mean $\pm$ SD retained in tables; ratio uncertainty is not estimated without raw paired replicates.
Reaction times differ (20/60 min); control normalization and replication ambiguities remain unresolved.
Single previously inspected publication, related chemistry; not fresh external or prospective validation.
